Practical - 2

Practical Title: Semantic HTML5 Pages with Accessibility-Ready Structure

Problem Definition: Develop static HTML5 skeletons for at least 10 StudentHub pages such as Home, About, Register, Login, Dashboard, Events, Profile, Contact, Timetable, and Attendance. Use semantic tags and accessibility-friendly structure. Do not use CSS.

A. Theory & Analysis

1. Are semantic tags such as header, nav, main, section, article, aside, and footer used properly?

Yes. Semantic HTML5 tags are used across all 10 pages in practical_02_html/ without any CSS styling. The <header> element encloses the university branding and page title; <nav> wraps the navigation menu; <main> marks the core content; <section> divides content into logical blocks; <article> encloses self-contained items like notices and event highlights; <aside> holds secondary guidelines; and <footer> contains copyright and secondary links. Using semantic elements gives clear structural meaning to browsers and assistive screen readers.

2. Are form labels, headings, image alt text, and navigation links accessible?

Yes. I added explicit <label for='inputId'> tags to all form controls matching unique input IDs so screen readers can identify each field. Headings follow a logical order from <h1> down to <h3> without skipping levels. All images include descriptive alt attributes (such as alt='CHARUSAT Official Logo') with HTML width attributes, and data tables include <caption>, <thead>, and <th scope='col'> headers for clear tabular reading.

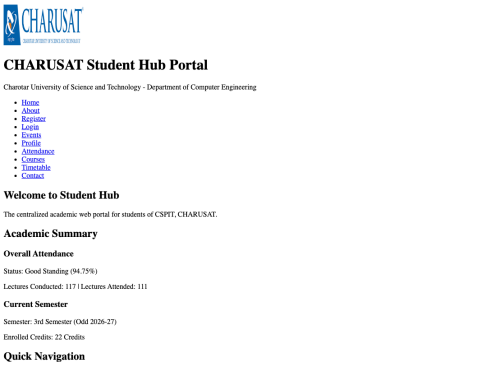

3. Is the page structure consistent across all pages without any CSS styling?

Yes. All 10 pages in practical_02_html/ share a consistent, pure HTML5 template: standard doctype, UTF-8 charset, viewport meta tag, semantic nav list, unified main section, and footer. No external stylesheets, internal <style> blocks, inline style attributes, or JavaScript are used in this practical, keeping the HTML structural implementation completely separated from later CSS styling work.

B. Implementation Details

I created 10 static, accessibility-ready HTML5 skeletons in practical_02_html/ (index.html, about.html, register.html, login.html, events.html, profile.html, attendance.html, courses.html, timetable.html, contact.html) using zero CSS and zero JS. The checklist below summarizes the implemented features across all pages:
[x] Semantic landmarks (header, nav, main, footer); [x] label-input associations;
[x] Logical heading hierarchy; [x] descriptive image alt text; [x] accessible tables with captions and header scopes.

C. Evidence of Work

Attendance Monitoring System

CHARUSAT mandates a minimum threshold of 75% attendance in each registered subject to appear for end-semester university examinations.

Attendance Summary Overview

Overall Percentage

94.75% (Status: Good Standing)

Total Lectures Conducted

117 Lectures

Lectures Attended

111 Lectures

Minimum Requirement

75.00% (University Norm)

Subject-Wise Attendance Breakdown

Semester 3 Attendance Register

Course Code	Course Title	Conducted	Attended	Percentage	Eligibility Status
ITUE203	Web Development Frameworks	30	29	96.67%	Eligible
CE244	Data Structures & Algorithms	32	31	96.88%	Eligible
CE245	Database Management Systems	28	26	92.86%	Eligible
CE246	Computer Organization & Architecture	27	25	92.59%	Eligible

E. Learning Outcomes

I learned to construct accessibility-ready web pages using semantic HTML5 elements, logical heading hierarchies, explicit form label associations, accessible data tables, and descriptive image alternative text without reliance on CSS styling.
